The American Journal of Obstetrics and Gynecology, Vol. 2 Sep 04 2021 Excerpt from The American Journal of Obstetrics and Gynecology, Vol. 2: July, 1921-December, 1921 Two methods at present are commonly employed; one, the introduction of a foreign body within the uterus to stimulate uterine contraction, Or the stimulation of the uterine contractions by rupturing the membranes and lessening the quantity of amniotic liquid, or, second, the administration of drugs. The induction of labor by psychic effect. While occasionally successful, is unreliable. In inducing labor, it is well not to ignore the mechanism of labor. The unshortened and unsoftened cervix requires something more than simple stretching in a lateral direction at right angles to the long axis of the uterus. The dilating bag does not favor the softening or retraction of the cervix, and this is one of the disadvantages attending this method. The introduction of bougies or a. Rectal tube, or gauze promotes the softening of the cervix, its retraction and obliteration, and is not likely to displace the presenting part. This method is not especially painful, or likely to result. In septic infection. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. This interactive learning system helps you to learn instead of memorize. *60 ob/gyn cases with complete discussions *Clinical pearls highlight key points *USMLE-style comprehension questions with each case *Primer on how to approach the patient *Proven learning system improves shelf exam scores "Superior to other case file books." --Chang-Kun Choi, Medical Student, Midwestern University School of Medicine "Using clinical scenarios not only makes the reading fun and interesting, but it is far more engaging than sitting down with a bulleted text and reviewing detail after detail. This is a much better way to learn clinical information. I have not read a book like this before, and I certainly have enjoyed it." --Eric Hossler, Medical Student, James H. Quillen College of Medicine "I LOVED this book! I would recommend this book to all third-year students... The book uses a clinical approach and does not lose sight of the pathophysiology behind the disease -- GREAT preparation for being on the wards! The subject matter is also deceptively detailed, with much more information than one normally finds in a text of case files. The reader can use this book as either a rigorous self-test or a read-through introduction to the subject. Once again - a GREAT text!" --Elizabeth Johnston, Medical Student, Emory University

Prostaglandins and Their Inhibitors in Clinical Obstetrics and Gynaecology Nov 13 2019 It is clear today that several prostaglandins play an important role in the regulation of many of the physiological events of the reproductive organs in the human. Both naturally occurring prostaglandins and their analogues are used routinely in many countries to ripen the cervix and induce labour at term as well as to dilate the cervix and to terminate pregnancy. Prostaglandin biosynthesis inhibitors are widely used in the treatment of primary dysmenorrhoea. The editors have aimed at an accurate, thorough, yet easily understandable review of the status in 1986 of medical knowledge regarding both the physiological importance and the clinical use of prostaglandins and their inhibitors in obstetrics and gynaecology. I believe this book will be of value for all clinicians concerned with reproductive health. The list of authors guarantees an authoritative and up-to-date review of this active field. Cyclopaedia of Obstetrics and Gynecology, Vol. 2 of 4 Aug 23 2020 Excerpt from Cyclopaedia of Obstetrics and Gynecology, Vol. 2 of 4: A Practical Treatise on Obstetrics; The Pathology of Pregnancy Measles is of rare occurrence during pregnancy, for only twenty or twenty-five cases at the most can be collected among different authorities. According to Levret, it equals in gravity the other eruptive fevers, and is almost

always accompanied by abortions and premature delivery. Grisolle and Cazeaux, on the other hand, observed two cases in which the pregnancy pursued its course. Bourgeois agrees with Levret. Among fifteen cases observed by him, he noted eight abortions or premature births of the eight children, five were non-viable (born before seven months) three at the seventh or eighth month. In women who were only between the second and fifth month of pregnancy, the disease pursued its usual course, but it became more severe as the pregnancy was more advanced. The premonitory symptoms of abortion appeared towards the end of the disease; as a rule, delivery did not occur until from one to three days later, and sometimes the disease had terminated. When women were attacked with the disease at the end of pregnancy, premature delivery took place at the outset, accompanied by fever and serious symptoms. The foetus was dead-born, or perished within a few hours or days after birth. The disease pursued its course and the women slowly recovered. In rare instances the children were born with measles. Bourgeois saw one case, the infant being born fifteen days before full term and living only three days. Gautier collected eleven cases, in six of which the children presented the morbillous eruption. Measles occurring during pregnancy, therefore, may predispose to the death of the foetus and to abortion; it does not endanger the mother. The prognosis during the puerperal state is less grave.
